Sublingual Immunotherapy for the Treatment of Allergic Rhinoconjunctivitis and Asthma

A Systematic Review

Sandra Y. Lin, MD
Nkiruka Erekosima, MD, MPH
Julia M. Kim, MD, MPH
Murugappan Ramanathan, MD
Catalina Suarez-Cuervo, MD
Yohalakshmi Chelladurai, MBBS
Darcy Ward, BA
Jodi B. Segal, MD, MPH

Importance Allergic rhinitis affects up to 40% of the US population. To desensitize allergic individuals, subcutaneous injection immunotherapy or sublingual immunotherapy may be administered. In the United States, sublingual immunotherapy is not approved by the Food and Drug Administration. However, some US physicians use aqueous allergens, off-label, for sublingual desensitization.

Objective To systematically review the effectiveness and safety of aqueous sublingual immunotherapy for allergic rhinoconjunctivitis and asthma.

Evidence Acquisition The databases of MEDLINE, EMBASE, LILACS, and the Cochrane Central Register of Controlled Trials were searched through December 22, 2012. English-language randomized controlled trials were included if they compared sub-

JAMA, 2013

Results Sixty-three studies with 5131 participants met the inclusion criteria. Participants' ages ranged from 4 to 74 years. Twenty studies (n=1814 patients) enrolled only children. The risk of bias was medium in 43 studies (68%). Strong evidence supports that sublingual immunotherapy improves asthma symptoms, with 8 of 13 studies reporting greater than 40% improvement vs the comparator. Moderate evidence supports that sublingual immunotherapy use decreases rhinitis or rhinoconjunctivitis symptoms, with 9 of 36 studies demonstrating greater than 40% improvement vs the comparator. Medication use for asthma and allergies decreased by more than 40% in 16 of 41 studies of sublingual immunotherapy with moderate grade evidence. Moderate evidence supports that sublingual immunotherapy improves conjunctivitis symptoms (13 studies), combined symptom and medication scores (20 studies), and disease-specific quality of life (8 studies). Local reactions were frequent, but anaphylaxis was not reported.

Conclusions and Relevance The overall evidence provides a moderate grade level of evidence to support the effectiveness of sublingual immunotherapy for the treatment of allergic rhinitis and asthma, but high-quality studies are still needed to answer questions regarding optimal dosing strategies. There were limitations in the standardization of adverse events reporting, but no life-threatening adverse events were noted in this review.

European Academy of Allergy and Clinical Immunology task force report on 'dose–response relationship in allergen-specific immunotherapy'

M. A. Calderón[1], D. Larenas[2], J. Kleine-Tebbe[3], L. Jacobsen[4], G. Passalacqua[5], P. A. Eng[6], E. M. Varga[7], E. Valovirta[8], C. Moreno[9], H. J. Malling[10], E. Alvarez-Cuesta[11], S. Durham[1] & P. Demoly[12]

[1]National Heart and Lung Institute, Imperial College London, London, UK; [2]Hospital Médica Sur, Mexico City, Mexico; [3]Allergy & Asthma Center Westend, Berlin, Germany; [4]Research Centre for Prevention and Health, Glostrup University Hospital, Glostrup, Denmark; [5]Allergy and Respiratory Diseases, DIMI, Department of Internal Medicine, Genoa, Italy; [6]Section of Allergy and Pulmonology, Children's Hospital Aarau and Lucerne, Switzerland; [7]Department of Paediatrics, Respiratory and Allergic Disease Division, Medical University Graz, Graz, Austria; [8]Suomen Terveystalo Allergy Clinic, Turku, Finland; [9]Seccion de Alergia, Hospital Reina Sofia, Cordoba, Spain; [10]Allergy Unit, University Hospital, Copenhagen, Denmark; [11]Allergy Division, Ramon & Cajal University Hospital, Alcala de Henares University, Madrid, Spain; [12]University Hospital of Montpellier, Montpellier, France

Results: Fifteen dose-ranging studies fulfilled the inclusion criteria and twelve reported a dose-response relationship for clinical efficacy. Several studies also reported a dose-response relationship for immunological and safety endpoints. Due to the use of different reference materials and methodologies for the determination of allergen content, variations in study design, and choice of endpoints, no comparisons could be made between studies and, as a consequence, no general dosing recommendations can be made.

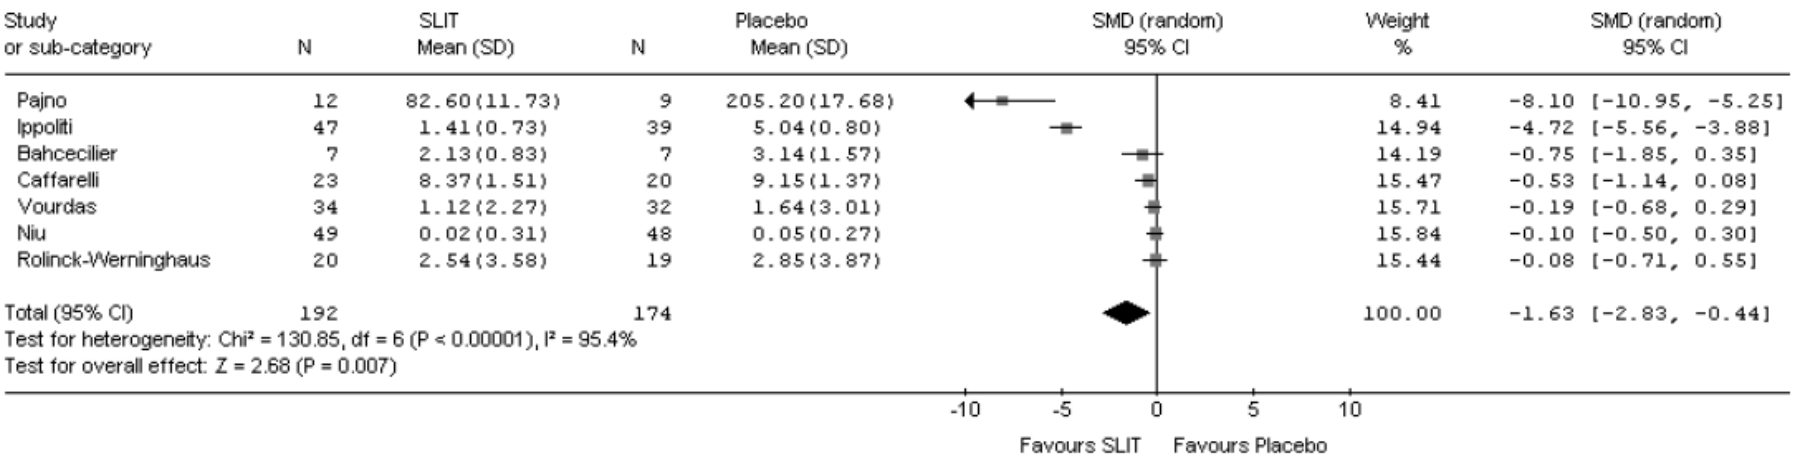
FIGURE 3. OUTCOME: MEDICATION SCORE.



GRADE:
Grading of Recommendation Assessment, Developing and Evaluation

Allergic Rhinitis and its Impact on Asthma (ARIA) guidelines: 2010 revision

Should subcutaneous specific immunotherapy be used for treatment of AR in adults without concomitant ASTHMA?

Recommendation
We suggest subcutaneous allergen specific immunotherapy in adults with seasonal AR (conditional recommendation | moderate-quality evidence) and persistent AR caused by mites (conditional recommendation | low-quality evidence).

Should subcutaneous specific immunotherapy be used for treatment of in children without concomitant ASTHMA?

Recommendation
In children with , we suggest subcutaneous specific immunotherapy (conditional recommendation | low-quality evidence).

Allergic Rhinitis and its Impact on Asthma (ARIA) guidelines: 2010 revision

Should subcutaneous allergen-specific immunotherapy be used in patients with AR and concomitant asthma?

Recommendation
In patients with AR and asthma , we suggest subcutaneous specific immunotherapy for treatment of asthma (conditional recommendation | moderate-quality evidence).

Should sublingual allergen-specific immunotherapy be used in patients with AR and concomitant asthma ?

Recommendation
In patients with AR and asthma, we suggest sublingual specific immunotherapy for treatment of asthma (conditional recommendation | low-quality evidence).

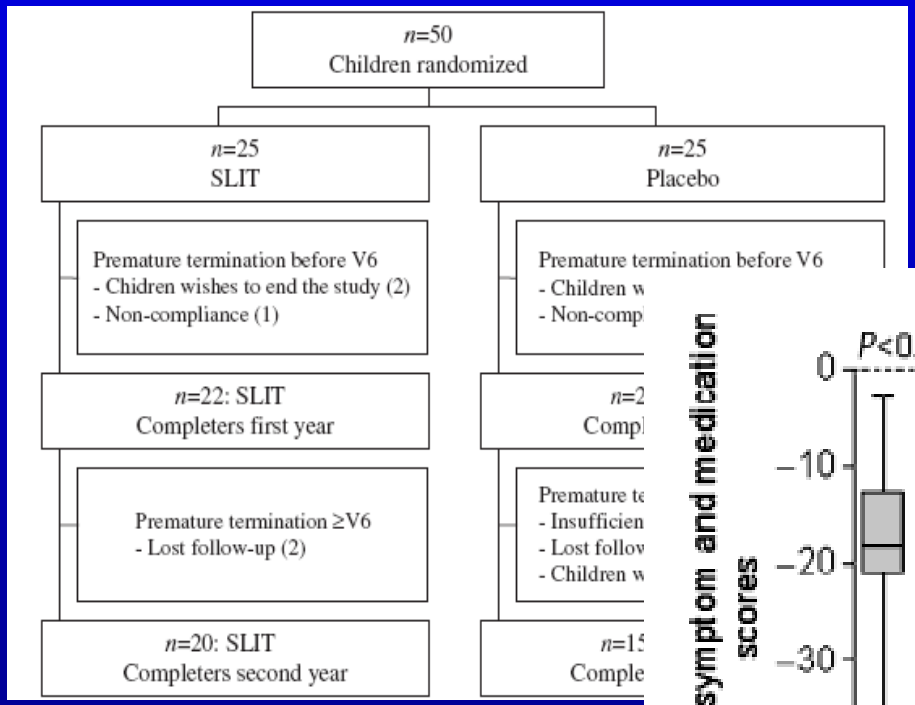
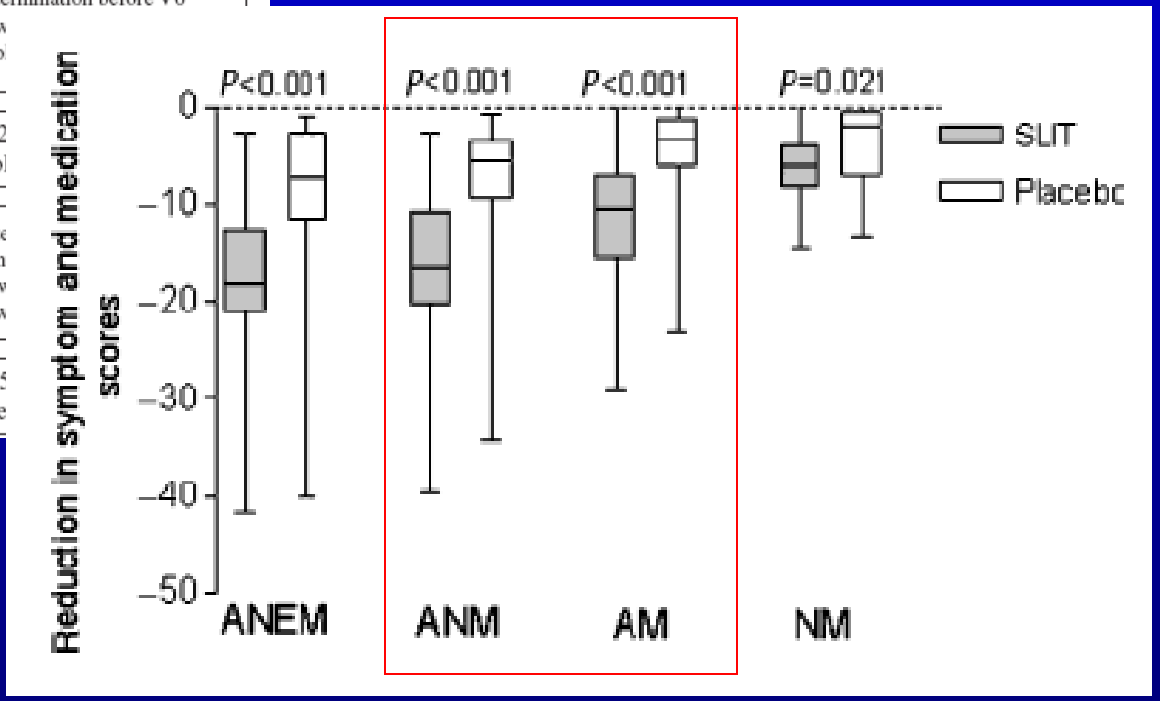
Efficacy and safety of high-doses sublingual immunotherapy in ultra-rush scheme in children allergic to grass pollen

I. Stelmach, J. Kaczmarek-Woźniak, P. Majak, M. Olszowiec-Chlebna and J. Jerzynska
Department of Pediatrics and Allergy, N Copernicus Hospital, Lodz, Poland

March 2009





PROBLEMS:

The majority of the trials were not designed and sized for asthma as primary outcome

Heterogeneity of study designs, duration, dose and evaluation parameters.

Few studies had functional parameters evaluated

Implications for clinical trials:

If asthma is investigated, the trial should consider asthma as primary outcome

Functional parameters (FEV1, VEMS, oscillometry) should be evaluated

Patients should be symptomatic, or therapeutic control should be evaluated.

REVIEW ARTICLE

Sublingual allergen immunotherapy: mode of action and its relationship with the safety profile

M. A. Calderón[1], F. E. R. Simons[2], H.-J. Malling[3], R. F. Lockey[4], P. Moingeon[5] & P. Demoly[6]

Table 1 Clinical efficacy of SLIT and SCIT in comparative studies

Authors	Year	Study design	Patients (*n*)	Patient age range	Allergen extract	Treatment duration	SLIT allergen dose (-fold the SCIT dose)	Conclusion in terms of efficacy
Bernardis et al. (9)	1996	Open, controlled, no placebo	23	5–26	*Alternaria tenuis*	2 years	×3.6	SLIT > SCIT
Quirino et al. (10)	1996	RCT, double-dummy, no placebo	20	13–39	Five grasses	1 year	×2.4	SLIT = SCIT
Mungan et al. (11)	1999	RCT, single-blind, placebo	36	18–46	Der p, Der f	1 year	×80	SLIT = SCIT
Khinchi et al. (12)	2004	RCT double-dummy, placebo	58	20–58	Birch	2 years	×210	SLIT = SCIT
Herrscher (13)	2006	Patient survey	328	3–71	Multi-allergen extracts	Typically 9–18 months	×5–10	SLIT = SCIT
Mauro et al. (14)	2007	RCT, no placebo	47	18–59	Alder, birch, and hazel	*Not stated*	×92	SLIT = SCIT

Implications for clinical trials:

The optimal study design to compare SLIT and SCIT is the DB DD RPC fashion

This is not currently feasible, due to economic limitations.

Changing the route of immunotherapy administration: An 18-year survey in pediatric patients with allergic rhinitis and asthma

Giovanni Pajno, M.D.,[1] Lucia Caminiti, M.D.,[1] and Giovanni Passalacqua, M.D.[2]

Table 2 **Changing SLIT to SCIT and *vice versa***

	SCIT TO SLIT (n = 54/648)	SLIT TO SCIT (n = 340/4285)	$p\chi^2$
%	8.3	7.9	NS
Nonadherence	5 (9.25%)	48 (14.12%)	NS
Side effects	49 (90.75%)	0	<0.001
Inefficacy	0	292 (85.88%)	<0.001
Parietaria	29 (4.47%)*	184 (4.29%)*	NS
Grass	18 (2.77%)*	110 (2.56%)*	NS
Dust mite	5 (0.77%)	41 (0.95%)	NS
Olive	2 (0.30)	5 (0.11%)	NS

Numbers, percentages, and reasons for shifting the regimen.
**SCIT for single allergen:* Parietaria, *10.62%, and grass, 8.32%.*
**SLIT for single allergen:* Parietaria *11.73%, and grass, 8.95%.*
NS = not significant; SCIT = subcutaneous immunotherapy; SLIT = sublingual immunotherapy.

Speaking the same language: The World Allergy Organization Subcutaneous Immunotherapy Systemic Reaction Grading System

Linda Cox, MD,[a] Desiree Larenas-Linnemann, MD,[b] Richard F. Lockey, MD,[c] and Giovanni Passalacqua, MD,[d] Editors

Davie and Tampa, Fla, M

TABLE I. World Allergy Organization Subcutaneous Immunotherapy Systemic Reaction Grading System (see text)

Grade 1	Grade 2	Grade 3	Grade 4	Grade 5
Symptom(s)/sign(s) of 1 organ system present* **Cutaneous** Generalized pruritus, urticaria, flushing, or sensation of heat or warmth† **or** Angioedema (not laryngeal, tongue or uvular) **or** **Upper respiratory** Rhinitis - (eg, sneezing, rhinorrhea, nasal pruritus and/or nasal congestion) **or** Throat-clearing (itchy throat) **or** Cough perceived to originate in the upper airway, not the lung, larynx, or trachea **or** **Conjunctival** Erythema, pruritus or tearing **Other** Nausea, metallic taste, or headache	***Symptom(s)/sign(s) of more than 1 organ system present*** **or** **Lower respiratory** Asthma: cough, wheezing, shortness of breath (eg, less than 40% PEF or FEV_1 drop, responding to an inhaled bronchodilator) **or** **Gastrointestinal** Abdominal cramps, vomiting, or diarrhea **or** **Other** Uterine cramps	**Lower respiratory** Asthma (eg, 40% PEF or FEV_1 drop NOT responding to an inhaled bronchodilator) **or** **Upper respiratory** Laryngeal, uvula, or tongue edema with or without stridor	**Lower or upper respiratory** Respiratory failure with or without loss of consciousness **or** **Cardiovascular** Hypotension with or without loss of consciousness	Death

Patients may also have a feeling of impending doom, especially in grades 2, 3, or 4.

Note: Children with anaphylaxis seldom convey a sense of impending doom and their behavior changes may be a sign of anaphylaxis; eg, becoming very quiet or irritable and cranky.

Scoring includes a suffix that denotes if and when epinephrine is or is not administered in relationship to onset of symptom(s)/sign(s) of the SR:a, ≤ 5 minutes; b, >5 minutes-to ≤10 minutes; c: >10 to ≤20 minutes; d:>20 minutes; z, epinephrine not administered.

The final grade of the reaction will not be determined until the event is over, regardless of the medication administered. The final report should include the first symptom(s)/sign(s) and the time of onset after the subcutaneous allergen immunotherapy injection*** and a suffix reflecting if and when epinephrine was or was not administered, **eg, Grade 2a; rhinitis:10 minutes.**

Final Report: Grade a-d, or z_____ First symptom(s)/sign(s)_____ Time of onset of first symptom_____

How adherent to sublingual immunotherapy prescriptions are patients? The manufacturers' viewpoint

To the Editor:

Adherence to prescriptions is crucial for all long-term treatments,[1] and this is true also for sublingual immunotherapy (SLIT), which is self-managed at home by the patients themselves. In fact, in the case of SLIT, medical supervision is usually limited to control visits or to prescription renewals. Available postmarketing studies indicate that the compliance with SLIT ranges from 50% to 95%, depending on age and on duration of treatment.[2] Nonetheless, the postmarketing surveys on compliance have an inherent limitation in that the observation itself can distort the results to some extent. In other words, when patients are aware that their compliance with treatment is recorded, they tend to be more adherent. Moreover, those studies assessed the adherence over limited periods, whereas SLIT should be continued for at least 3 years, according to recommendations. In everyday clinical practice, the general perception is that a large proportion of patients discontinues the prescribed SLIT, and this usually happens within the first year.

To address this latter aspect better, and to quantify the rate of discontinuations in real life, we collected the Italian sales figures from 2 large manufacturers (Stallergenes Italy, Milan, and ALK-Abelló Italy, Lainate, Milan), who kindly provided their data subdivided as per the 20 Italian administrative regions. It is to be noted that these manufactures account for more than 60% of the Italian immunotherapy market. To assess the discontinuation rates

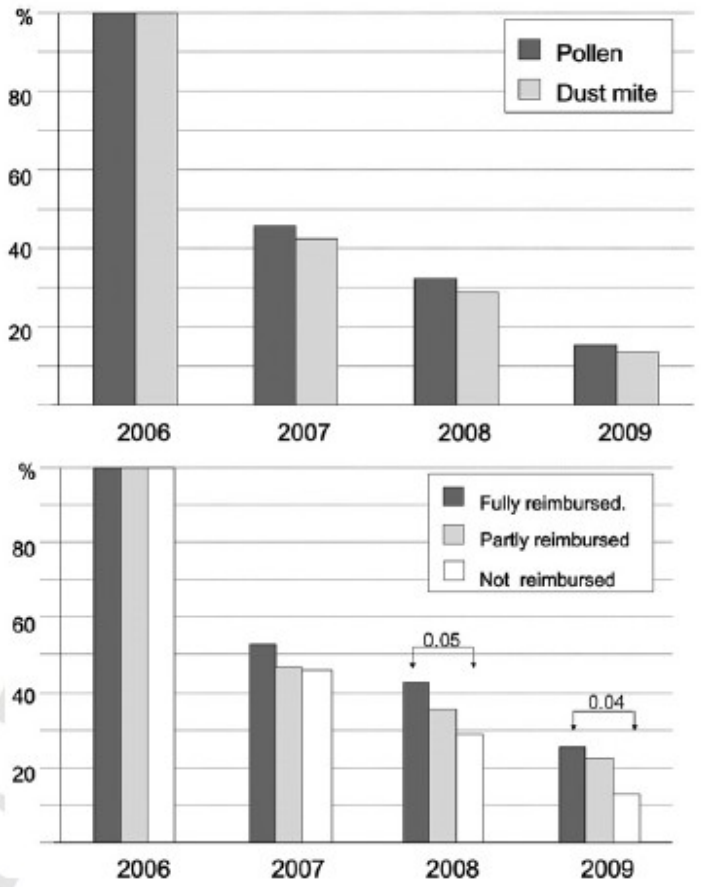

FIG 1. Percentages of SLIT treatments still ongoing at 1, 2, and 3 years after the initial prescription. *Upper panel,* Percentages for pollens and house dust mite SLITs. *Lower panel,* Percentages according to the reimbursement modality.

A systematic review and economic evaluation of subcutaneous and sublingual allergen immunotherapy in adults and children with seasonal allergic rhinitis

A Meadows, B Kaambwa, N Novielli, A Huissoon, A Fry-Smith, C Meads, P Barton and J Dretzke

Results: Meta-analyses found statistically significant effects for SCIT and SLIT compared with placebo across a number of outcome measures and for the vast majority of subgroup analyses (type and amount of allergen, duration of treatment). There was less evidence for children, but some results in favour of SLIT were statistically significant. Indirect comparisons did not provide conclusive results in favour of either SCIT or SLIT. Economic modelling suggested that, when compared with symptomatic treatment (ST), both SCIT and SLIT may become cost-effective at a threshold of £20,000–30,000 per quality-adjusted life-year (QALY) from around 6 years, or 5 years for SCIT compared with SLIT (NHS and patient perspective).

Recommendations for appropriate sublingual immunotherapy clinical trials

Thomas B. Casale, MD,[a] G. Walter Canonica, MD,[b] Jean Bousquet, MD,[c] Linda Cox, MD,[d] Richard Lockey, MD,[e] Harold S. Nelson, MD,[f] and Giovanni Passalacqua, MD[b] *Omaha, Neb, Genoa, Italy, Montpellier, France, Davie and Tampa, Fla, and Denver, Colo*

TABLE III. Points to consider for randomized controlled trials in SLIT

Allergen vaccine	
Composition	Single allergen or mixtures
If mixture	Compatible allergens in liquid form with proven stability
Standardization	Defined based on major allergen content
Updosing regimen	Not required
Dose	~5 μg major allergen/d recommended
Patient selection	
Assess all sensitizations (monosensitization or polysensitization)	Panel of allergens using skin prick tests
Prove concordance of sensitization and symptoms because not all sensitizations are clinically relevant	Skin prick tests and serum-specific IgE Optional: allergen challenge
Assess severity of symptoms before SLIT	● Historical: moderate to severe symptoms with exposure in previous year ● Run-in (difficult to do for seasonal allergens) with low pretreatment symptoms
Report comorbidities	May be used in the analysis
Exclude patients who received SIT within 5 y	
Study design	
● Randomized ● Double-blind ● Placebo-controlled: appropriate predefined minimal symptom increase during pollen season	

JACI, Oct 09

Rescue medication	● Standardized list ● Weighted medication score
Primary outcome	● Total symptom score ● Combined symptom-medication score (preferred) ● For asthma: coprimary, FEV_1 or peak expiratory flow
Secondary outcomes	● Rescue medications ● Individual symptoms ● Visual analog scale ● QOL ● Asthma control ● Symptom-free days ● Physician and patient rated clinical global improvement

Unmet needs of allergen-specific immunotherapy in children

- Optimal dose and dosing frequency of administration
- Frequency of side effects and safety
- Efficacy and safety in patients unresponsive to pharmacotherapy
- For SLIT: Drops vs. tablets
- Duration of treatment
- Long-term efficacy and safety
- Preventive capacity (asthma, new sensitizations)
- Identification of immunological biomarkers
- Definition of duration of disease before starting treatment (minimal age)
- Development of generally accepted primary outcome measures (i.e. symptom medication scores)
- Studies targeting children with moderate asthma
- Evaluating the effectiveness of allergen-specific immunotherapy in real life in allergic rhinitics with concomitant asthma, especially in terms of a steroid-sparing effect.
- Cost-effectiveness studies and pharmaco-economic aspects
- Developing strategies to enhance adherence
